CHARACTERISTICS

The outstanding flow properties of Promyde B300 P2 G15 MI allow a reduction in molding temperature. This has two advantages: the cycle time is shorter and less energy is needed in injection molding. Because Promyde B300 P2 G15 MI has better flow, lower injection pressure is needed which reduces the clamping force, longer flow paths are possible and the mold is easier to design.

This material is distinguished by high mechanical strength and impact resistance.

Parts made from Promyde B300 P2 G15 MI have particularly high dimensional stability and creep strength.

APPLICATIONS

Promyde B300 P2 G15 MI is used in a wide range of applications where a combination of mechanical properties, thermal resistance and resistance to breakage by impact is needed.

The flow properties of Promyde B300 P2 G15 MI combined with its excellent mechanical and thermal properties make it suitable for a **wide range of industrial, automotive and electrical applications, especially in long flow path and thin wall parts.**

FORMAT AND STORAGE

Promyde B300 P2 G15 MI is supplied in moisture-proof packaging. Typical formats are Big Bag, octabin, and 25kg bags.

All containers are perfectly sealed. The product should be stored in a dry place and opened just before processing.

PROCESSING GUIDELINES

Drying

Material is supplied ready to process with a low moisture content. When moisture absorption is prevented drying is not required. When drying is necessary, conditions are:

Drying temperature ≤ 80 °C

Drying time: 4-6 hours

Injection moulding

The recommended processing parameters for injection moulding are:

Melt temperature: 240-290°C

Mould temperature: 40-80 °C

Injection speed: medium to high

Back pressure: moderate

Shrinkage

The shrinkage of a moulded part is influenced by wall thickness, mould gating, and moulding conditions.

Moisture

A particular characteristic of reinforced polyamide 6 is its combination of moderate tensile and flexural strength with rigidity, good impact strength, and friction resistance. However, when a moulded part absorbs moisture, tensile and flexural strength decrease and toughness increases.

NOTE

All recommendations are based on knowledge and experience; The values have been established on standardized tests. The figures should be regarded as guide values and not as binding minimum values. As many factors may affect processing or applications, we recommend that customers make their own tests to determine the suitability of a product for its particular use.
